

This isn't a Mac.

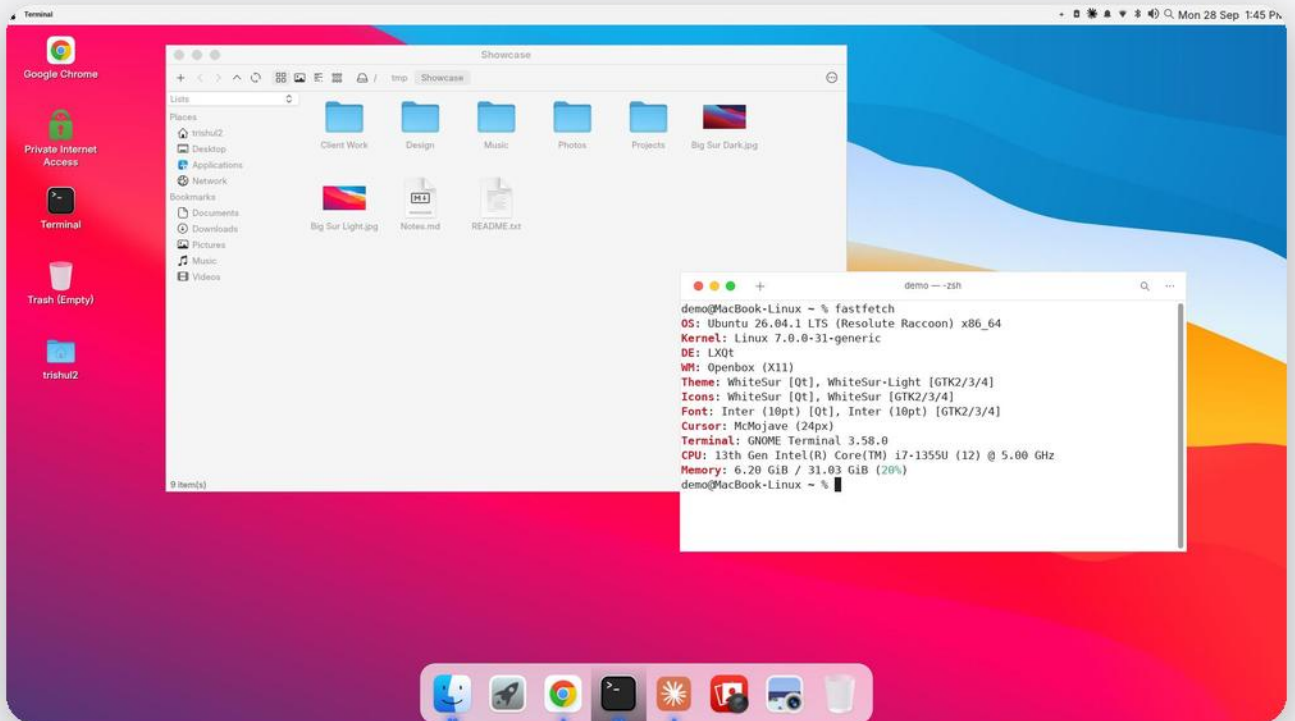

It's a free Linux laptop. I didn't touch a single config file: I just told an AI what I wanted, one request at a time.

Swipe →

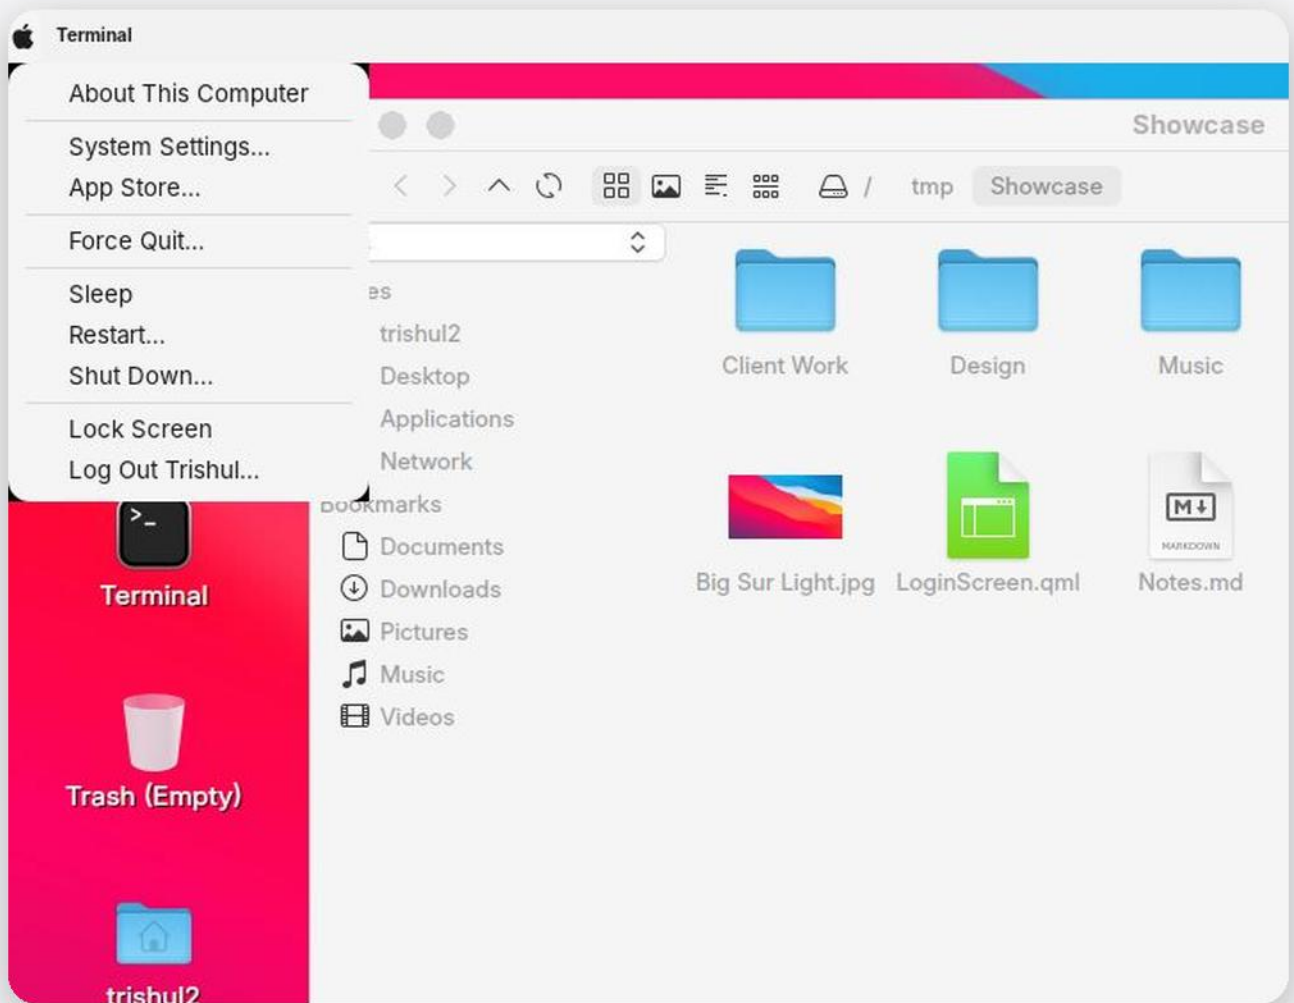

The desktop

Menu bar, Finder, Terminal and the Dock. And yes, that's Ubuntu underneath.

The menu bar

Apple menu, app name, and it follows the wallpaper, just like macOS does.

Spotlight

Super + Space, type three letters, hit Enter.

🔍 fin|

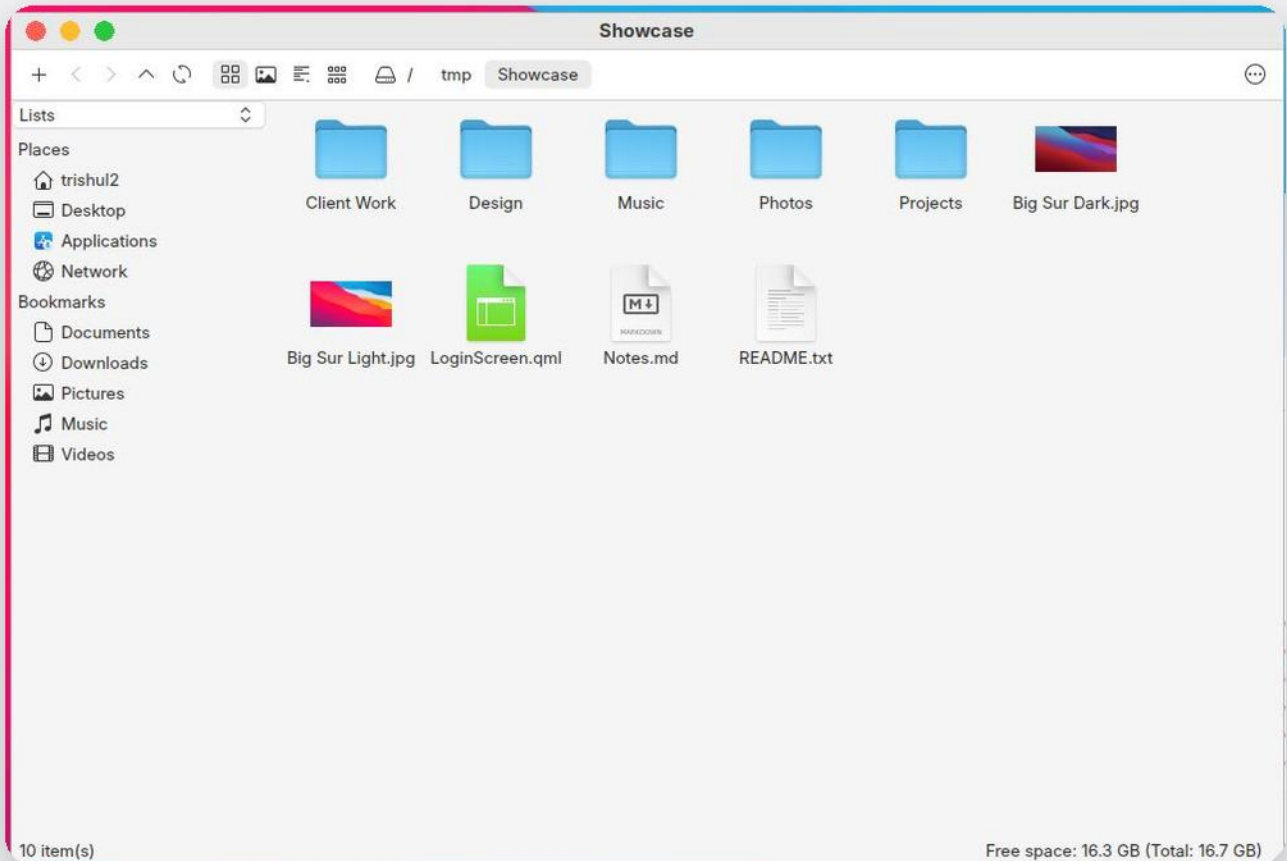

Finder

Qalculate! (Qt)

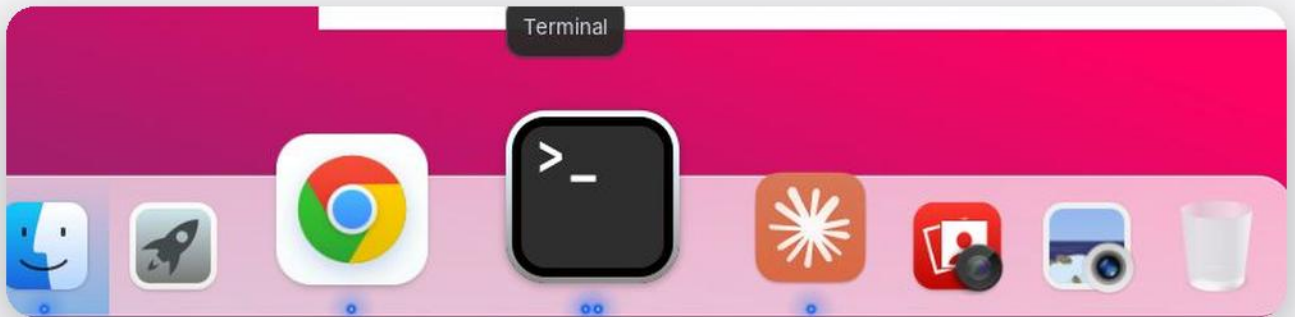

Finder

Favorites-style sidebar, big icons, traffic lights. (It's PCManFM-Qt in disguise.)

The Dock

Magnification on hover, running dots, Trash at the end. Launchpad is the rocket.

How it got built

Me: what 'good' feels like. AI: all the typing.

Rule #1

Back up everything. One command undoes it all.

I describe

"Make the dock feel like a Mac." "The tabs are too small."

It crashed my desktop

Rolled back in under a minute. Even an empty stylesheet crashed it: a real bug, not the AI.

It caught its own mistake

Screenshots looked grey for hours. It found the cause, and admitted earlier checks weren't real checks.

A capital S, three attempts

Linux wanted "space", not "Space". The hundred tiny details are where AI shines.

Result

Launchpad, Spotlight, Finder, Dock, login screen: all free software.

Try it yourself

One script. One command to undo it all. Lubuntu 26.04, plus a GNOME version for regular Ubuntu.
